A plastid stroma targeting transit peptide is present. DNA encoding the protein may be inserted in a vector or expression cassette in sense or antisense orientation for expression in an oilseed plant, e.g. for production of transgenic rape plants with low or modified oil content, diversion of metabolism to alternative storage compounds, e.g. starch, protein or engineered polymers, or production of plants with enhanced oil content. The DNA may also be used as a probe to obtain similar genes from other plants. The transit peptide may be used to direct other proteins to seed

The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative cused to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, graft vs host disease, cardiovascular disease, diabetes mellitus, hyperthematosus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, nocturnal haemoglobinuria, antiinflammatory disease; to enhance coagulation; to inhibit thrombosis; and as a contraceptive.

                                                                                                                                                                                                                                                                                                                                                                                                                                                          dehydrogenase enzymes catalyse an irreversible reaction between pyruvate and coenzyme A, to form CO2 and the intermediate COA, in mitochondria. Host cells containing vectors comprising the HSCD nucleic acid may be used to produce the HSCD enzyme, according to standard recombinant DNA methodology. The enzyme may then be used as an antigen in the production of antibodies or in assays to identify antagonists of HSCD activity. These antagonists may then be used to treat disorders associated with inappropriate expression, or over activity of HSCD such as immune disorders and cancers (the antagonist interferes with the reaction between pyruvate and coenzyme A). For example, the antagonists may be used to treat leukemia, lymphomas, adenocarcinomas and cancers of the breast, lung, testis, prostate and brain, Addison's disease, acquired mmune deficiency variations and brain, Addison's disease, acquired
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nucleic acids encoding human short chain dehydrogenase enzymes useful for the diagnosis, prevention and treatment of disorders associated with abnormal expression of the enzyme, such as immune

                                    The glucose dehygrogenase enzyme is encoded by a recombinant DNA clone from Bacillus megaterium. The sequence may be mutated by site directed mutagenesis to introduce mutations to the protein sequence (see feature table). The DNA may be used to transform E. coli cells, and transformants may be cultured to mass produce GDH.
                   coli cells, and The mutant GDH i tetramer and is
                                                                                                                            Glucose dehydrogenase prepn. using transformed recombinant from Bacillus megaterium - has specified transformations giglucose dehydrogenase-expressing vector, introduced into E.

                                                                                                                                                                                                                                                                                                                                                                                                                                        The normal Glu-96 residue is replaced by Lys, Gly or Ala,Gln-252 by Leu or Tyr-253 by Cys. Ser-22 residue can also be Ala, Asp-43 can be Glu, Ala-79 can be Ser and Leu-95 can be Met.E. coli containing this sequence will produce a form of GDH with improved heat stability. the enzymes are useful for glucose assay and can be produced at low costs see also Q03772.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Glucose dehydrogenase; Bacillus megaterium; glucose assay; ss.

                                                                                                                                                                                                                                                                                                 This sequence represents the claDH protein which is a putative clavulanate-9-aldehyde reductase used in the biosynthetic pathway for clavulanic acid in Streptomyces clavullegerus. The invention relates to methods of improving production of clavulanic acid by Streptomyces by super-expression of claR gene. The claR gene is characterised in that it is localised in the gene group encoding genes for biosynthesis of clavulanic acid.

a modified polylinker; Site_1: Not I; Site_2: Eco RI;
plasmid DNA from the normalized library NCI_CGAP_Kid3 was
prepared, and ss circles were made in vitro. Following HAP
purification, this DNA was used as tracer in a subtractive
hybridization reaction. The driver was PCR-amplified cDNAs
from a pool of 5,000 clones made from the same library
(cloneIDs 132376-132391, 1456007-1456775, and
1500552-1502855). Subtraction by Bento Soares and M.
Fatima Bonaldo. "
